

Namit Singh

Business & Data Analyst

PRINCE2® 7 Certified | MSc Business Analytics, Warwick Business School

✉ namitt.singh@gmail.com | ☎ +44 7774 865494 | 📍 Manchester, UK | [LinkedIn](#) | [GitHub](#) | [Portfolio](#)

Profile

I work at the point where a business problem becomes a data problem. Three years across retail, hospitality and consulting, covering requirements and process analysis on one side, data quality, modelling and reporting on the other. I've run an HRIS implementation, worked the business side of a data migration, and built warehouses, pipelines and models in my own time. MSc Business Analytics, taught entirely in R.

Core Skills

Business Analysis — Requirements elicitation, discovery workshops, stakeholder interviews, BRDs and functional specifications, non-functional requirements, user stories and acceptance criteria, As-Is/To-Be process mapping, data flow diagrams, gap analysis, root cause analysis, requirements traceability, MoSCoW prioritisation, UAT, business readiness and adoption

Data & Analytics — SQL (joins, CTEs, window functions), Python (pandas, NumPy, scikit-learn), R (statistical modelling, regression, hypothesis testing), Power BI, Tableau, data visualisation, advanced Excel (Power Query, PivotTables), exploratory data analysis, statistical and predictive modelling, segmentation, forecasting, experimental design

Data Engineering & Governance — Dimensional and 3NF data modelling, Bronze/Silver/Gold medallion architecture, ETL pipelines with scheduled validation, source-to-target mapping, data quality rules, duplicate identification, source of truth and data ownership, data lineage, migration reconciliation, UK GDPR and Data Protection Act 2018

Delivery — Agile (Scrum, Kanban), SDLC, JIRA, Trello, backlog management, sprint planning, PRINCE2 7 governance, hybrid delivery, defect management

Experience

People & Culture Data Analyst, Primark

Sep 2025 – Present

myP&C HRIS implementation — retail, 550+ employee population

Gathered business and reporting requirements from HR stakeholders, Store Managers and Business Partners through a business-wide HR technology transformation. Rebuilt the recurring reporting process, replacing manual spreadsheet preparation with standardised reporting and **cutting recurring reporting time by 35%**. Designed the validation and audit controls that hold **96% data accuracy across 550+ employee records**, investigating discrepancies at source rather than correcting them in reporting. Trained **20 line managers** on system processes and data standards, improving quality at the point of entry. Produce reporting packs on headcount, absence and turnover with written commentary and recommendations.

PMO Business Analyst, Pratapvasini

Sep 2024 – Aug 2025

Remote role delivered from the UK. Business analysis and data workstream on a digitisation and migration programme — hospitality business integrating with an international hotel brand, working alongside Data SMEs who performed the technical migration.

Ran discovery across multiple workstreams through stakeholder workshops and interviews, documenting the As-Is state across process steps, information flows and dependencies. Analysed a legacy landscape of manual registers, paper forms, invoices, operational, logistics and staff records, and defined the To-Be digital process and data model. Produced source-to-target data mapping with business definitions, transformation rules, validation rules and ownership, working with Data SMEs to confirm that fields matching technically also matched in meaning. Established data quality rules across completeness, accuracy, consistency, uniqueness and validity, and determined source of truth where the same entity existed across conflicting sources. Reconciled migrated populations against source and explained every variance. Translated business needs into user stories and acceptance criteria with full traceability, and ran UAT through to defect closure. Managed Agile delivery in JIRA across parallel workstreams.

Retail Operations Supervisor, Poundland

Dec 2023 – Jul 2025

Part-time, alongside postgraduate study and remote analyst work

Supervised store operations, colleague coordination and workflow. Supported the rollout of the Poundland Rewards app, coordinating store readiness, colleague communication and customer adoption. Provided operational support to management teams across nearby stores. Analysed store performance, customer activity and stock availability to support decisions. Managed workforce scheduling against trading patterns and peak demand.

Project Data Analyst, MyCaptain

Jun 2022 – Aug 2023

EdTech — multi-project Agile delivery

Built and maintained programme KPI dashboards covering delivery progress, backlog, milestones and project health for management decision-making. Facilitated stakeholder discussions to clarify project and reporting requirements. Validated delivery data and identified inconsistencies in how teams applied status definitions across projects, agreeing common definitions before unreliable figures reached management reporting. Managed sprint tracking, backlog and dependencies in JIRA.

Personal Projects

Customer Shopping Behaviour Analytics | Python, SQL Server, Tableau | [Repo](#)

- Cleaned and feature-engineered a **3,900-row** retail dataset (**\$233K revenue**) in Python/pandas, then answered **15 business questions** in SQL Server across revenue drivers, product performance, customer segmentation and purchasing behaviour, using CTEs, window functions and conditional aggregation.
- Built **five Tableau dashboards** across 17 worksheets and produced a written report and stakeholder presentation translating findings into customer and product recommendations.

SQL Data Warehouse & Analytics | SQL Server | [Repo](#)

- Designed a SQL Server data warehouse using Bronze/Silver/Gold layers, integrating ERP and CRM sources into a dimensional model.
- Built a **17-script** Gold-layer analytics suite covering RFM segmentation (NTILE), retention and repeat purchase, month-over-month growth (LAG) and basket affinity, with reporting views built for Power BI and Tableau consumption.

End-to-End E-Commerce Data Pipeline | R, SQLite, GitHub Actions, Quarto | [Repo](#)

- Designed a normalised (3NF) relational schema and built an automated ETL pipeline with scheduled ingestion, validation and referential-integrity checks running every six hours via GitHub Actions.
- Analysed customer and product behaviour across **7,684 products** sold in R, producing a reproducible Quarto report.

RAG System | Python, Sentence-Transformers, FAISS | [Repo](#)

- Built a semantic retrieval pipeline grounding generated answers in retrieved source content, and documented where the generator drifted past what it had actually retrieved into plausible but unsupported detail.

Virtual Experience Programmes

Structured industry simulation programmes

Data Analytics — Quantum

- Built a reusable control-store selection function benchmarking 260+ stores on Pearson correlation and a scaled distance metric, matching test and control on pre-period behaviour, then measured trial impact with t-tests against scaled baselines, establishing a significant +12–26% uplift driven by customer acquisition rather than higher spend.
- Segmented \$1.8M in annual sales across 21 customer segments and translated the findings into pricing and pack-size recommendations.

Digital Transformation — Boston Consulting Group

- Modelled revenue, gross profit and profit per transaction across a 3,300-transaction dataset with sensitivities for national scale-up, recommending against the headline pilot (+30% revenue) after finding it volume-driven and margin-dilutive.
- Identified that neither pilot ran a concurrent control group, so reported gains could not be separated from week-on-week variation, and specified the data capture and holdout design required before the benefit could be evidenced.

Data Visualisation — Tata Consultancy Services

- Cleaned and validated a **540,000+ row** transaction dataset, defining the data-quality rules that removed invalid records so downstream reporting was audit-traceable, then designed four executive visualisations and presented a five-market expansion recommendation.

Education \& Certifications

MSc Business Analytics — Warwick Business School, University of Warwick | 2023 – 2024

Taught and assessed in R throughout. Modules: Advanced Data Analysis (statistical modelling, hypothesis testing, regression), Digital Strategies & Agile Transformation, Supply Chain Analytics

BE Electronics Engineering — University of Mumbai | 2019 – 2023

Modules: Advanced Database Management, Management Information Systems, Project Management

Certifications:

PRINCE2® 7 | Databricks Fundamentals | BCS Foundation Certificate in Business Analysis — in progress
