

Namit Singh

Business & Data Analyst | PRINCE2® 7 Certified

namitt.singh@gmail.com | +44 7774 865494 | Manchester | [Linkedin](#) | [Github](#) | [Portfolio](#)

PROFESSIONAL SUMMARY

Business & Data Analyst with two years' experience delivering HRIS implementations and digital transformation across retail, PMO, People & Culture reporting roles and consulting. Skilled in stakeholder requirements, process mapping, and JIRA delivery management. Reduced recurring reporting time by **35%** while maintaining **96% data compliance** across **550+ records**. MSc Business Analytics with hands-on ETL and data warehousing project experience, including an automated pipeline and SQL warehouse, PRINCE2® 7 certified, working towards the BCS Foundation Certificate in Business Analysis.

KEY SKILLS

Business Analysis: As-is / to-be process mapping, process documentation, business impact assessment, stakeholder engagement and workshop facilitation, requirements elicitation through stakeholder interviews, requirements prioritisation (MoSCoW), user training and adoption support

Delivery & Change: Agile delivery (Scrum, Kanban), JIRA, Trello, sprint tracking, backlog management, milestone and risk reporting, HRIS implementation, digital transformation programmes

Data Analysis & Reporting: SQL (joins, CTEs, window functions), Power BI, Tableau, Excel (modelling, pivot tables), data validation and accuracy checks, trend and anomaly detection, ETL and data pipeline development

Tools & Platforms: SQL Server (SSMS), Python, Microsoft Azure, Microsoft 365 (Excel, Word, PowerPoint, Teams, SharePoint)

EXPERIENCE

People & Culture Data Admin, Primark | Sep 2025 – Present

myP&C HRIS rollout — retail, 550+ employee population

- Cut recurring people-reporting time by 35% by replacing manual, spreadsheet-heavy processes with standardised, repeatable reporting, freeing analyst hours for higher-value investigation work.
- Held 96% data compliance across 550+ employee records by embedding routine audit and validation checks into the team's workflow, catching errors at source rather than downstream.
- Delivered 90% of assigned project milestones on time during the business-wide rollout of myP&C, Primark's people-system platform, working to requirements set by the Store Manager and P&C Business Partner.
- Drove system adoption by designing and delivering hands-on myP&C training to 20 line managers across 2 sessions, improving data quality at the point of entry where most people-data errors originate.
- Advised HR stakeholders on headcount, absence, and turnover trends, translating raw people data into decision-ready answers through clear reporting packs pitched at non-technical audiences.

PMO / Data Analyst, Pratapvasini | Sep 2024 – Aug 2025

Digital transformation programme — multi-workstream

- Elicited business requirements from client-side stakeholders across multiple transformation workstreams through structured 1:1 interviews, prioritising the resulting requirements using MoSCoW to support scoping and delivery decisions.
- Mapped as-is and to-be business processes across the transformation programme, documenting current-state workflows and target-state designs to support process redesign decisions.
- Tracked programme delivery in JIRA, maintaining workstream boards and status reporting that gave leadership a single view of progress across multiple concurrent workstreams.
- Replaced manual reporting with maintained Power BI, Tableau and Excel dashboards, giving leadership faster access to accurate programme performance and compliance insight.
- Analysed multi-workstream data sets to surface trends and anomalies, translating findings into recommendations that guided strategic decisions across the programme.
- Safeguarded reporting accuracy through routine validation checks, and supported initiatives to improve data capture accuracy at the point of entry.

Project Data Analyst Intern, MyCaptain | Jun 2022 – Aug 2023

- Facilitated stakeholder workshops bridging business and technical development teams to scope requirements and align deliverables.
- Oversaw timelines, sprint tracking, and backlog management for multiple Agile projects using JIRA and Trello.
- Built and maintained programme KPI dashboards enabling executives to make data-driven decisions on project direction and scope.

JOB SIMULATIONS

Data Analytics, Quantum

- Segmented \$1.8M in annual chip sales across 21 lifestyle × affluence groups, identifying Mainstream Young Singles/Couples as the top-opportunity segment and translating findings into targeted pricing and pack-size recommendations.
- Built a reusable control-store selection function, benchmarking 260+ stores via Pearson correlation and a scaled magnitude-distance metric for valid like-for-like uplift testing.

- Measured trial-layout impact with t-tests on scaled control baselines, proving a statistically significant +12–26% sales uplift driven by customer acquisition, not higher spend per customer.

Quantitative Research, JPMorgan Chase & Co.

- Built a natural gas price estimation model in Python (pandas, NumPy), decomposing 4 years of price data into trend and seasonal components for on-demand lookups and 12-month extrapolation; validated by exactly reproducing all 48 historical data points.
- Designed a storage contract pricing engine computing fair value of arbitrary injection/withdrawal schedules by netting commodity, storage, transport, and handling cash flows under facility rate and capacity constraints; validated against a hand-calculated reference case and automated tests.
- Trained and compared logistic regression, gradient boosting, and random forest models to predict default probability on a 10,000-loan portfolio, selecting logistic regression for interpretability; achieved AUC $\approx$ 0.9998 and reconciled modelled expected loss to within 0.01% of realised losses.
- Engineered a dynamic programming algorithm ($O(n^2r)$ partitioning) to convert FICO scores into optimal rating buckets, maximising a log-likelihood objective and confirming global optimality against brute-force search; diagnosed and fixed a bucket-count edge case causing non-monotonic ratings.

Digital Transformation, Boston Consulting Group

- Analysed a 3,300-transaction dataset across a baseline week and two personalisation pilots, building a live Excel model of revenue, gross profit, and profit per transaction with sensitivities for national scale-up.
- Found the higher-revenue pilot (+30%) was volume-driven and margin-dilutive (profit/transaction -0.5%), while the lower-revenue pilot delivered a structural +6.9% ticket size and +4.8% profit/transaction; recommended scaling the latter.
- Identified that neither pilot ran a concurrent control group, gains reflected week-on-week variation, not measured impact, and specified the customer ID, holdout design, and store-level tagging needed to support a business case.

Data Visualisation: Empowering Business with Effective Insights, Tata Consultancy Services

- Cleaned and validated a 540,000+ row transaction dataset, defining data-quality rules to remove invalid quantities and pricing errors for audit-traceable executive reporting.
- Designed 4 executive-facing visualisations (time-series, dual-axis, ranked bar, treemap) surfacing seasonal revenue patterns, top international markets, and customer revenue concentration.
- Delivered stakeholder presentation translating findings into a data-backed expansion recommendation across five priority markets.

PROJECTS

SQL Data Warehouse & Analytics | [Github Repo](#)

- Built a SQL Server data warehouse using Bronze/Silver/Gold medallion architecture, consolidating ERP and CRM source data into a star schema; architecture followed a guided tutorial, with independent implementation, cleansing logic, and documentation.
- Extended it with an original 17-script analytics layer including 4 self-designed analyses beyond the guided material: retention and repeat-purchase rate, RFM segmentation (NTILE), month-over-month growth (LAG), and basket-affinity analysis via self-join, plus two reporting views built for Power BI/Tableau consumption.

Consumer Shopping Behaviour Analytics | [Github Repo](#)

- Delivered end-to-end analysis of a 3,900-row consumer shopping dataset (\$233K revenue) covering revenue drivers, customer segmentation, and product performance — cleaning data in Python (pandas), running exploratory SQL in SSMS across 15 business questions in four themes, and visualising findings in a multi-dashboard Tableau build.

End-to-End E-Commerce Data Pipeline | [Github Repo](#)

- Designed a normalised (3NF) relational schema for a simulated e-commerce platform and built an automated ETL pipeline using GitHub Actions, running ingestion, validation, and referential-integrity checks on a 6-hour schedule.
- Analysed purchasing behaviour across 7,684 products sold, reporting on membership-tier split (70/30 Prime to non-Prime), category demand, and regional delivery distribution using R and Quarto.

Library Management System | [Github Repo](#)

- Designed a relational schema in MySQL covering branches, employees, members, and book issue/return tracking, implementing full CRUD operations, CTAS summary tables, and stored procedures for issuing/returning books and branch performance reporting.

EDUCATION & CERTIFICATIONS

MSc Business Analytics, Warwick Business School | 2023 – 2024

Modules: Advanced Data Analysis, Digital Strategies & Agile Transformation, Supply Chain Analytics

BE Electronics Engineering, University of Mumbai | 2019 – 2023

Modules: Advanced Database Management, Management Information Systems, Project Management

Certifications

PRINCE2 7 | JIRA Fundamentals (Atlassian) | Basics of Scrum (PMI) | BCS Foundation in Business Analysis — in progress
