

Namit Singh

Business & Data Analyst | PRINCE2® 7 Certified

✉ namitt.singh@gmail.com | 📞 +44 7774 865494 | 📍 Manchester | 🔗 LinkedIn | 🌐 GitHub | 📁 Portfolio

Professional Summary

Business & Data Analyst with three years across retail, PMO and consulting, delivering HRIS implementation and digital transformation. Runs the full requirements cycle from elicitation and process mapping through to UAT, and builds reporting in SQL, Power BI and Tableau. Cut recurring reporting time by **35%** and maintains **96% data compliance** across 550+ employee records.

Key Skills

Business Analysis: Requirements elicitation, stakeholder management, workshop facilitation, user story creation, acceptance criteria, business requirements documentation (BRDs), functional documentation, As-Is/To-Be process mapping, data flow diagrams, requirements traceability, MoSCoW prioritisation, UAT support, business readiness, change adoption.

Delivery & Change: Agile delivery (Scrum, Kanban), JIRA, Trello, sprint tracking, backlog management, milestone and risk reporting, HRIS implementation, digital transformation programmes.

Data Analysis & Reporting: SQL (joins, CTEs, window functions), Power BI, Tableau, advanced Excel (Power Query, PivotTables), data validation and accuracy checks, trend and anomaly detection, ETL and data pipeline development.

Tools & Platforms: SQL Server (SSMS), Python, R, Microsoft Azure, Microsoft 365 (Excel, Word, PowerPoint, Teams, SharePoint).

Experience

People & Culture Data Admin, Primark

Sep 2025 – Present

myP&C HRIS rollout — retail, 550+ employee population

- Collaborated with HR stakeholders, Store Managers and People & Culture Business Partners to elicit business and reporting requirements supporting the store-wide myP&C HRIS rollout.
- Reduced recurring people-reporting time by 35% by replacing manual spreadsheet-based reporting with standardised reporting solutions.
- Maintained 96% data compliance across 550+ employee records through audit controls and validation checks.
- Contributed to the successful delivery of 90% of assigned project milestones during the business-wide rollout of Primark's myP&C platform.
- Delivered training to 20 line managers, supporting business readiness, user adoption and improved data quality.
- Produced reporting packs covering headcount, absence and turnover trends, translating workforce data into actionable business insights.

PMO Business Analyst, Pratapvasini

Sep 2024 – Aug 2025

Digital transformation programme — multi-workstream

- Facilitated stakeholder workshops and one-to-one interviews to elicit, analyse and prioritise business requirements across multiple transformation workstreams.
- Produced user stories, acceptance criteria and functional documentation to support Agile delivery and successful implementation.
- Developed As-Is/To-Be process maps and data flow diagrams, documenting current processes and identifying opportunities for operational improvement.
- Collaborated with Project Managers, developers and technical SMEs to translate business requirements into delivery-ready solutions.
- Maintained requirements traceability throughout project delivery, ensuring business requirements aligned with implemented solutions.
- Managed Agile delivery using JIRA, maintaining sprint boards, backlog items and project progress across multiple workstreams.
- Supported UAT by preparing test scenarios, validating functionality, logging defects and coordinating issue resolution.
- Analysed multi-workstream data to identify trends, improve reporting accuracy and support data quality and governance.

Project Data Analyst, MyCaptain

Jun 2022 – Aug 2023

- Facilitated stakeholder workshops bridging business and technical development teams to scope requirements and align deliverables.
- Oversaw timelines, sprint tracking and backlog management for multiple Agile projects using JIRA.
- Built and maintained programme KPI dashboards enabling executives to make data-driven decisions on project direction and scope.

Job Simulations

Data Analytics, Quantum

- Segmented \$1.8M in annual chip sales across 21 lifestyle × affluence groups, identifying Mainstream Young Singles/Couples as the top-opportunity segment and translating findings into targeted pricing and pack-size recommendations.
- Built a reusable control-store selection function, benchmarking 260+ stores via Pearson correlation and a scaled magnitude-distance metric for valid like-for-like uplift testing.

- Measured trial-layout impact with t-tests on scaled control baselines, proving a statistically significant +12–26% sales uplift driven by customer acquisition rather than higher spend per customer.

Quantitative Research, JPMorgan Chase & Co.

- Built a natural gas price estimation model in Python (pandas, NumPy), decomposing 4 years of price data into trend and seasonal components for on-demand lookups and 12-month extrapolation; validated by exactly reproducing all 48 historical data points.
- Designed a storage contract pricing engine computing fair value of arbitrary injection/withdrawal schedules by netting commodity, storage, transport and handling cash flows under facility rate and capacity constraints; validated against a hand-calculated reference case and automated tests.
- Trained and compared logistic regression, gradient boosting and random forest models to predict default probability on a 10,000-loan portfolio, selecting logistic regression for interpretability; achieved AUC ≈ 0.9998 and reconciled modelled expected loss to within 0.01% of realised losses.
- Engineered a dynamic programming algorithm ($O(n^2r)$ partitioning) to convert FICO scores into optimal rating buckets, maximising a log-likelihood objective and confirming global optimality against brute-force search; diagnosed and fixed a bucket-count edge case causing non-monotonic ratings.

Digital Transformation, Boston Consulting Group

- Analysed a 3,300-transaction dataset across a baseline week and two personalisation pilots, building a live Excel model of revenue, gross profit and profit per transaction with sensitivities for national scale-up.
- Found the higher-revenue pilot (+30%) was volume-driven and margin-dilutive (profit/transaction -0.5%), while the lower-revenue pilot delivered a structural +6.9% ticket size and +4.8% profit/transaction; recommended scaling the latter.
- Identified that neither pilot ran a concurrent control group, so gains reflected week-on-week variation rather than measured impact, and specified the customer ID, holdout design and store-level tagging needed to support a business case.

Data Visualisation, Tata Consultancy Services

- Cleaned and validated a 540,000+ row transaction dataset, defining data-quality rules to remove invalid quantities and pricing errors for audit-traceable executive reporting.
- Designed 4 executive-facing visualisations (time-series, dual-axis, ranked bar, treemap) surfacing seasonal revenue patterns, top international markets and customer revenue concentration.
- Delivered stakeholder presentation translating findings into a data-backed expansion recommendation across five priority markets.

Projects

SQL Data Warehouse & Analytics | [🔗 Repo](#)

- Designed and implemented a SQL Server data warehouse using Bronze/Silver/Gold architecture, integrating ERP and CRM data into a dimensional model supporting analytics and reporting.
- Extended it with an original 17-script analytics layer including four self-designed analyses beyond the guided material: retention and repeat-purchase rate, RFM segmentation (NTILE), month-over-month growth (LAG) and basket-affinity analysis via self-join, plus two reporting views built for Power BI/Tableau consumption.

Consumer Shopping Behaviour Analytics | [🔗 Repo](#)

- Delivered end-to-end analysis of a 3,900-row consumer shopping dataset (\$233K revenue) covering revenue drivers, customer segmentation and product performance: cleaning data in Python (pandas), running exploratory SQL in SSMS across 15 business questions in four themes, and visualising findings in a multi-dashboard Tableau build.

End-to-End E-Commerce Data Pipeline | [🔗 Repo](#)

- Designed a normalised (3NF) relational schema for a simulated e-commerce platform and built an automated ETL pipeline using GitHub Actions, running ingestion, validation and referential-integrity checks on a 6-hour schedule.
- Analysed purchasing behaviour across 7,684 products sold, reporting on membership-tier split (70/30 Prime to non-Prime), category demand and regional delivery distribution using R and Quarto.

Library Management System | [🔗 Repo](#)

- Designed a relational schema in MySQL covering branches, employees, members and book issue/return tracking, implementing full CRUD operations, CTAS summary tables and stored procedures for issuing/returning books and branch performance reporting.

Education & Certifications

MSc Business Analytics, Warwick Business School

2023 – 2024

Modules: Advanced Data Analysis, Digital Strategies & Agile Transformation, Supply Chain Analytics

BE Electronics Engineering, University of Mumbai

2019 – 2023

Modules: Advanced Database Management, Management Information Systems, Project Management

Certifications: PRINCE2 7 | Databricks Fundamentals | JIRA Fundamentals (Atlassian) | Basics of Scrum (PMI) | BCS Foundation in Business Analysis — in progress
